2

AMENDMENTS TO THE CLAIMS

Please amend the claims as follows:

1. (Original) An apparatus for scrubbing acid gas from a gas stream comprising:

(a) a closed reaction vessel for containing a treatment fluid comprising

aqueous and gaseous ammonia, said vessel having at least one reverse

weir dividing the vessel into at least two chambers and having a gas inlet

in one chamber and a gas outlet in another chamber; and

(b) a source of solid iron within the vessel wherein said iron source may be

in contact with either of or both the aqueous and gas phases of the

treatment fluid.

2. (Original) The apparatus of claim 1 wherein the vessel comprises low carbon

steel and wherein the source of solid iron comprises an inner surface of the

vessel.

3. (Original) The apparatus of claim 1 wherein the vessel is an horizontally

elongate cylinder and the reverse weir is transverse and substantially vertical.

4. (Original) The apparatus of claim 1 further comprising a tower baffle system

associated with the gas outlet wherein the tower baffle system comprises an

elongate outlet tower and a plurality of baffles which each partially extends

across the outlet tower, diverting the gas stream along a circuitous path within

the outlet tower.

5. (Original) The apparatus of claim 4 wherein the tower baffle system comprises

uncoated low carbon steel.

6. (Original) The apparatus of claim 4 further comprising baffle flexing means.

DMSLegal\045722\00002\1967761v1 DRAFT 03/10/05 8:12 AM 7. (Original) The apparatus of claim 6 wherein the baffle flexing means comprises a float and a push rod connected to the float and to at least one baffle such that

vertical movement of the float causes the at least one baffle to move or flex.

8. (Original) The apparatus of claim 1 further comprising a liquid re-circulation

system comprising a pump, means for powering the pump and a sprinkler bar

wherein the pump may draw liquid from the bottom of the vessel and distribute

the liquid through the sprinkler bar which is disposed at or near the top of the

vessel.

9. (Original) The apparatus of claim 8 wherein the sprinkler bar sprays the liquid

onto the inner surface of the vessel and/or through the gas phase.

10. (Original) The apparatus of claim 1 wherein the vessel further comprises a first

weir defining an inlet chamber for containing some liquid treatment fluid, a

downcomer for introducing the gas stream into the liquid treatment fluid in the

inlet chamber, and at least two reverse weirs separating the remainder of the

vessel into three chambers downstream from the inlet chamber.

11. (Original) The apparatus of claim 1 further comprising a condenser connected

upstream of the gas inlet for removing condensable hydrocarbon vapours from

the gas stream before the gas stream enters the vessel.

12-20 (Previously Cancelled).

21-29 (Cancelled).
